Kept

A guarded next best action for promises customers can keep.

Team Sharpe Shooters • CIBC Collections Hackathon • 4 Oct 2026

1M
customers,
one golden ID each

96,000
guarded actions
a night

62.5%
vs 51.5% of promised
money paid when dated
to payday

Promises set up to break

48.8%

of cases entering at 1-30 days past due roll by day 30

and rolling is the only road to charge-off

2,352

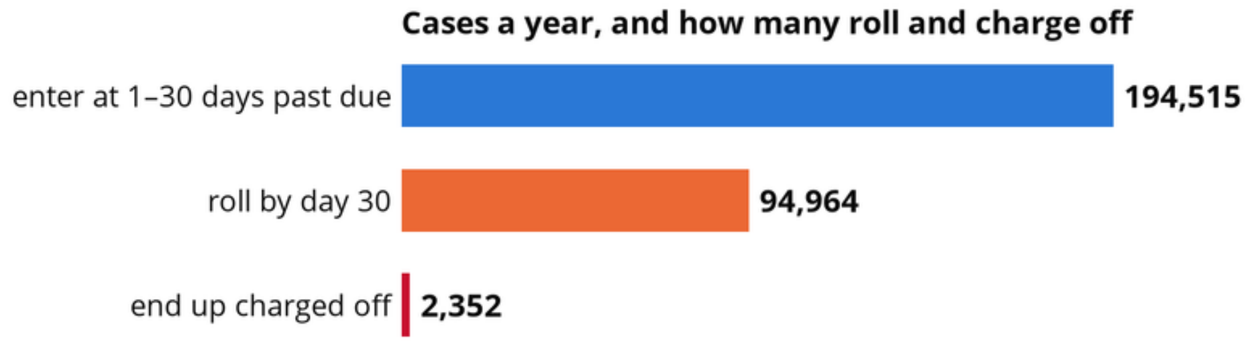

charge-offs a year

One person, five IDs across 31 tables

The facts live in free-text notes

Promises fall due before payday

Hardship found too late

Rolling is the only road to a charge-off: 2.5% of rolled cases charge off (average $12.5K), 0% of the rest.

When you ask matters as much as who you ask

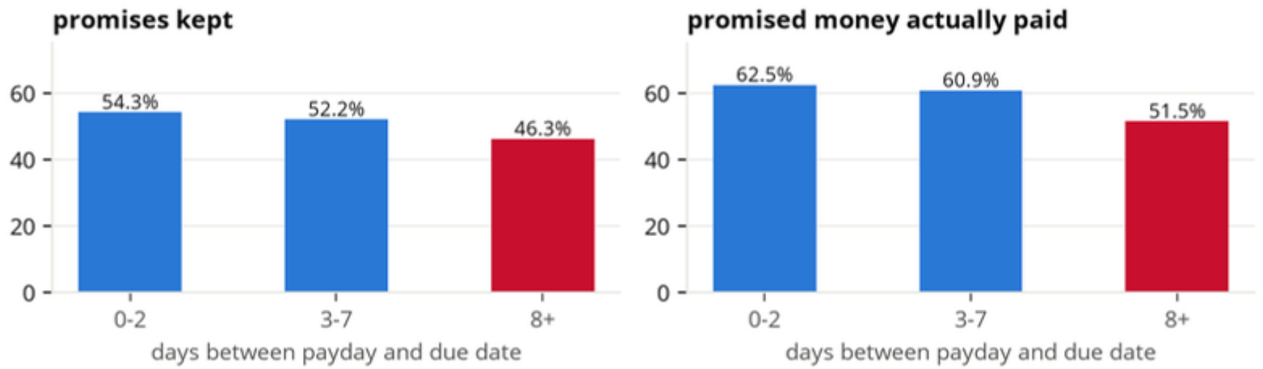

62.5%

of promised money paid when the promise is dated 0-2 days after payday

51.5%

of promised money paid when the promise is dated 8+ days after payday

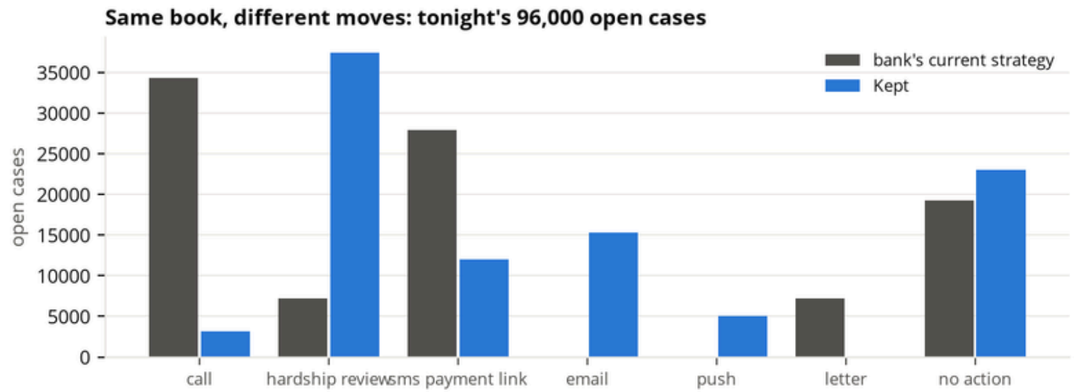

Based on 32,000 resolved promises with visible salary deposits

So Kept dates every promise 1–2 days after the customer's payday, sized to their spare cash.

One card per case

Rules first, then an uplift model, then a promise sized to payday. Every card shows three plain-English reasons.

1 → **2** → **3** → **4** → **5** → **6** → **7**

Call targeting (Qini)

4x

vs the bank's current strategy

0.0073 vs 0.0017

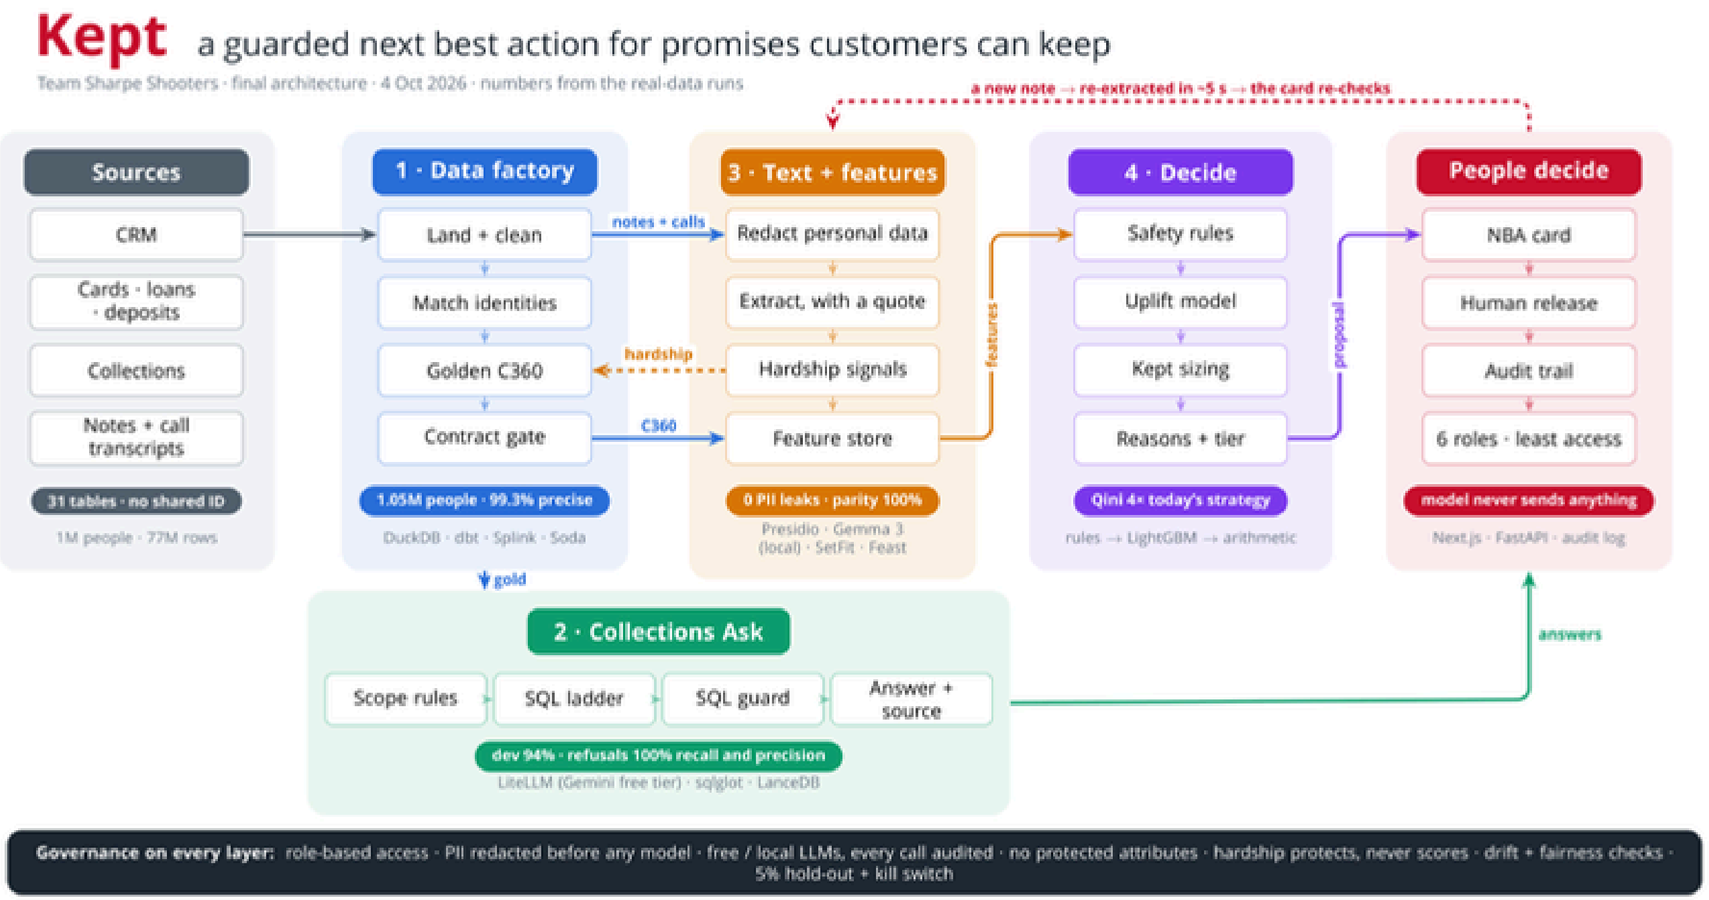

ACTION TIERS

GREEN	AMBER	RED
Self-serve	Needs an agent	Needs a specialist plus a team lead

A PERSON RELEASES EVERY ACTION

Same book, different moves: about as many calls as today, but 37K become hardship reviews, and $1.10 letters become near-free texts.

Four layers, governance through all of them

Our own TikZ diagram. Governance runs through every layer.

Data you can trust

68.2M

rows across 31 tables

3.84M → 1.05M

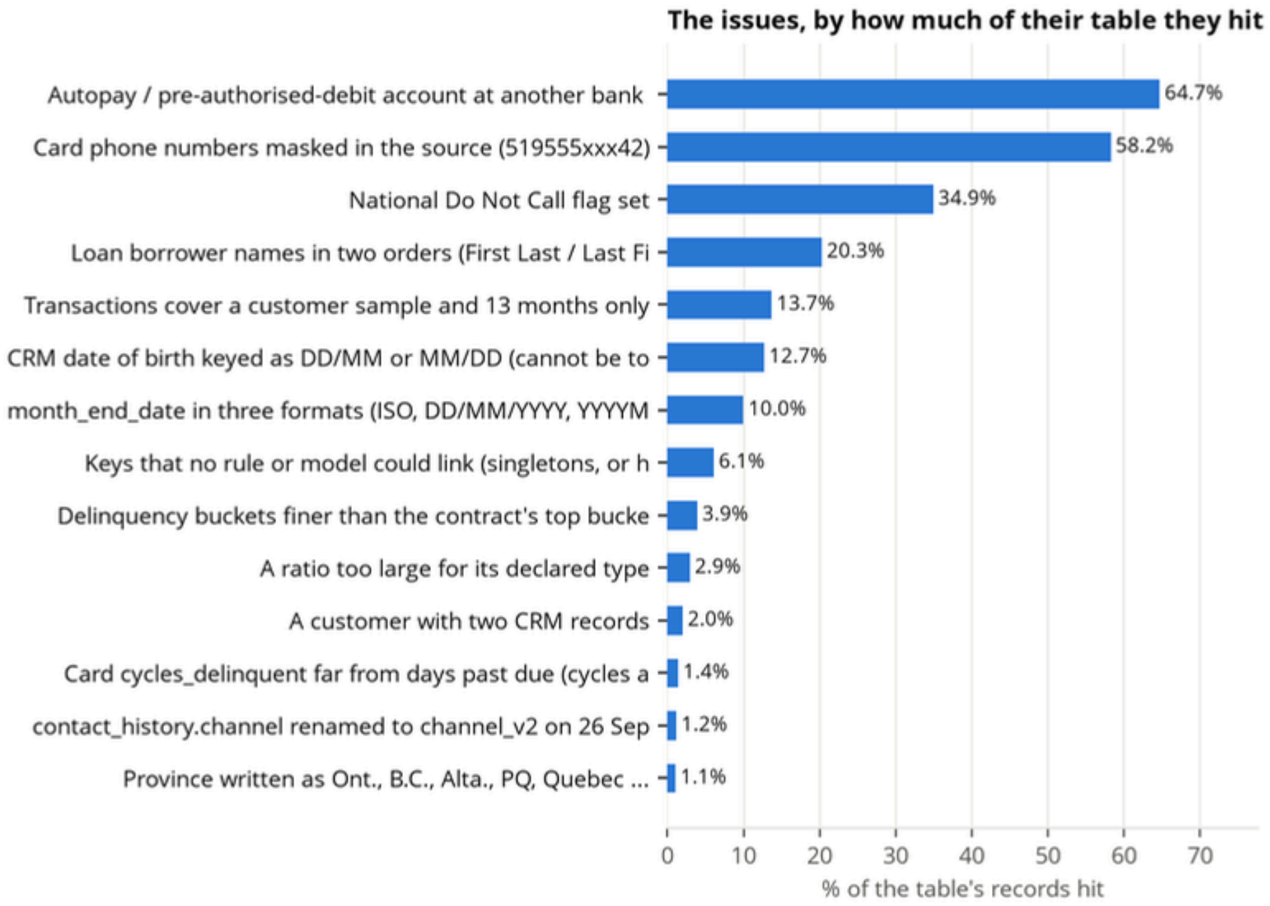

source keys to golden IDs at 99.3% precision

19

data-quality issues counted and fixed

PASS

contract gate on all 8 rules

Every issue counted and handled with a tested rule; nothing guessed. The contract gate, built from DC-COLL-001, blocks a bad load.

Ask in plain English, get answers with their working

20 of 21

dev benchmark questions right (17 of 18 in scope, 3 of 3 refusals)

100%

refusal recall

100%

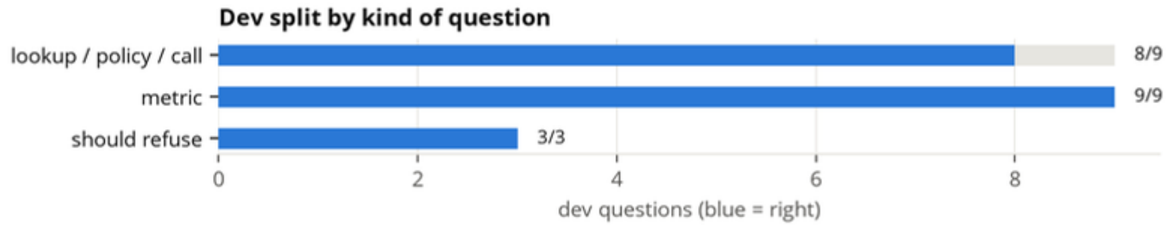

refusal precision

Every answer shows its SQL or a cited source you can check.

Protected-attribute questions refused before any LLM sees them.

How a question gets answered

1. Rules first: refuse protected, bulk-PII and write questions
2. Certified metrics and SQL templates; dates worked out in code
3. Free SQL last: three drafts, majority vote
4. Guard: SELECT only, on 17 approved tables
5. Every number in the answer must appear in the result rows

Free LLMs only (Gemini free tier for the Ask, Gemma 3 run locally for notes); every call is audited.

Fair by construction

0 of 96,000

decisions change when every protected attribute is scrambled

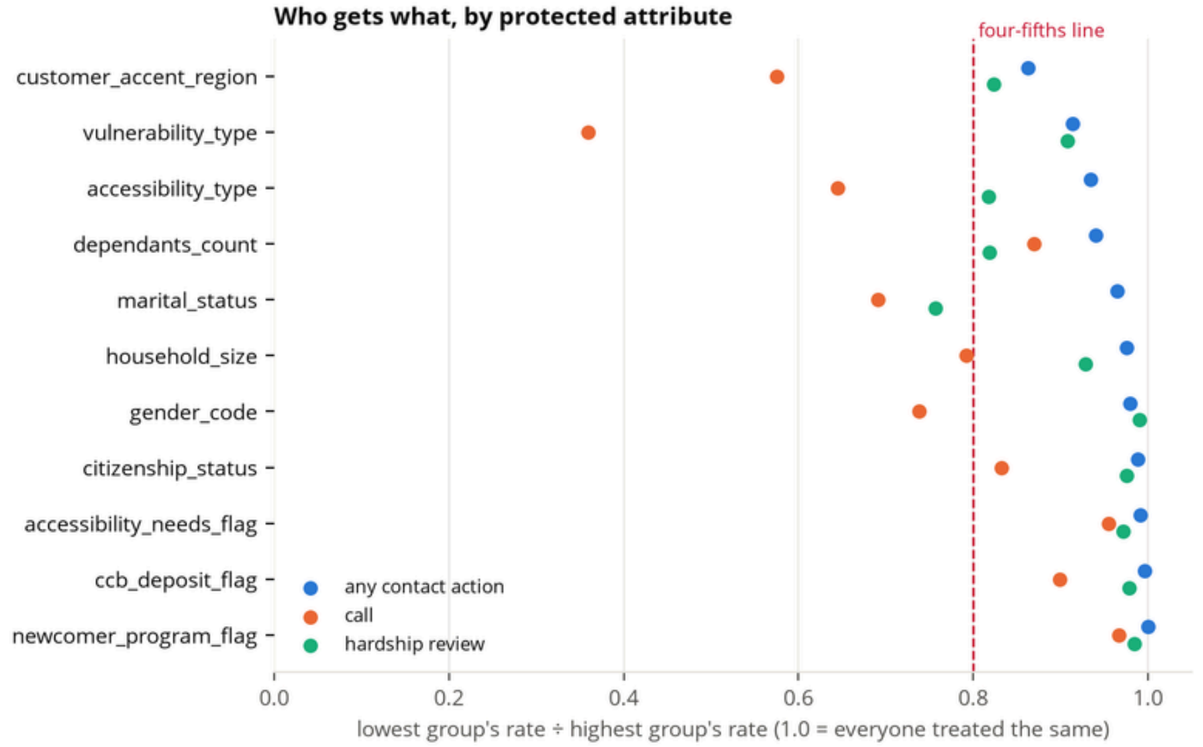

0.86–1.00

any-contact ratio across every protected attribute (four-fifths line 0.80)

scrambling proxies too moves

299 cards

all toward more protection

Blue = any contact action, all at 0.86 or above. The flags sit on rare calls and on protective hardship reviews.

$2.2M a year, paid back in about 2 months

$2.2M a year ($1.0M–4.2M)

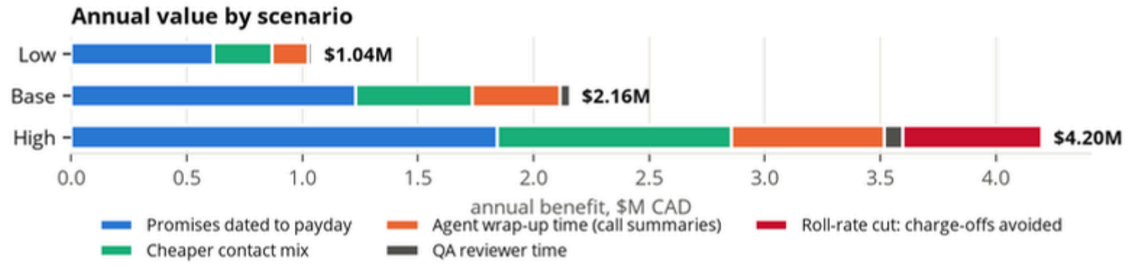

3.8x year-one ROI

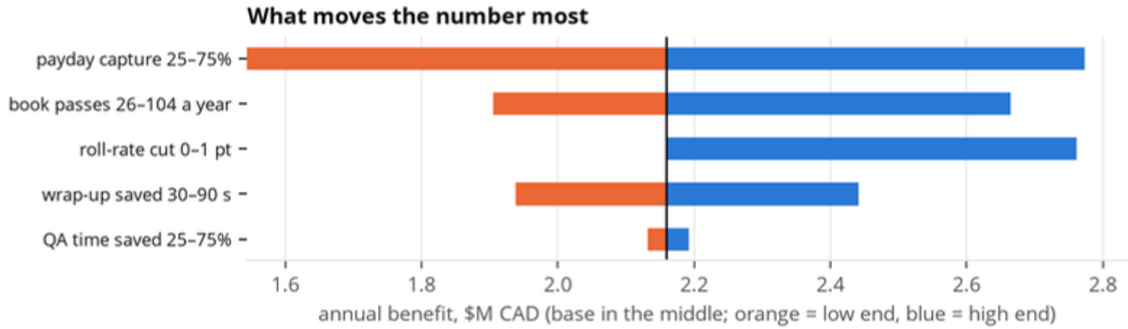

~2 months payback

$300K build

$150K run a year

Measured with a 5% hold-out and a kill switch.

Payday capture is the biggest lever. A 5% hold-out on today's strategy measures the real lift.

Built together. Promises customers can keep.
